

DataPorc from Porcofram Marketing a division of BOCM PAULS Ltd

DataPorc – BOCM PAULS' carcase (post farm gate) data processing and analysing system not only occupies the market leading position in the UK, but is now franchised overseas.

The DataPorc suite of software solutions is undergoing a continuous programme of development as the UK processing industry becomes increasingly capable of moving data more rapidly back down the supply chain.

DataPorc has been designed with the objective of assisting Producers and Processors optimise the financial performance from the carcase. An emerging development we see increasing rapidly going forward is for the data to be automatically integrated into on-farm (pre farm gate) production monitoring systems and BOCM PAULS' Pig Growth Simulator. This assists in ensuring that carcase quality requirements are matched to the need for efficient on-farm performance, leading to enhanced profitability for our customers and supply chain partners.

DataPorc is also being integrated into databanks that enable rapid commercial analysis of different production systems, eg permutations of genetics, feed systems, housing types, etc. This adds significant value to the supply chain in strengthening traceability and product provenance, as well as identifying opportunities to enhance financial incomes.

The DataPorc suite includes:

DataPorc 2 (DP2) – Porcofram's mainframe pig payments programme

- Automatically audits all individual pig payments providing full financial analysis
- Creates the only Defra approved electronic AML2 documentation
- Provides automatic confirmations to Producer/Haulier/Processor of agreed transactions
- Provides rapid data analysis on each load which can be supplied electronically through Porcofram's DataPorc/DITP systems

DataPorc Information Transfer System (DITP)

DataPorc Carcase Management Programme (DCMP)

DITP and DCMP are Porcofram's unique franchiseable software systems available for use by Producer and Processor alike.

DITP – A simple solution for receiving data electronically from Porcofram.

- Invaluable for assisting in optimising carcase returns
- Creates graphical charts for ease of interpretation
- Has facility for importing more detailed reports from DCMP

DCMP – A more sophisticated software solution for the larger Producer or Processor.

- Enables data to be analysed across different contract matrices
- DCMP's databanking system enables different permutations of large volumes of data to be rapidly extracted for analysis
- Analysed reports can be automatically blended into production/batch reports to create "Birth to Hook" unit reports
- Creates league tables of performance from stored permutations of unit types

DataPorc Bureau System

This is the latest addition to the Porcofram DataPorc family which is now being used by a significant proportion of the UK industry.

The benefits of our Bureau system include:

- Provides a completely bespoke analysis package for the Producer
- Leaves data management to the experience of the DataPorc team
- Includes industry analysis from similar production systems to provide realistic targets

To learn more about the family of DataPorc carcase programmes and/or BOCM PAULS Pig Growth Simulator Programme to see how they can assist you to optimise the financial performance of your pig supply please contact:
